Manjula Kamaraju, MD Jun 5, 12:43 PM

Hi Srikrishna

Your lipid panel shows some improvement with your total cholesterol now at 209 and HDL at 49, which has increased from 42 previously. However, your LDL remains elevated at 140, which is above the desirable range of less than 100. Given your history of hyperlipidemia, prediabetes, and elevated lipoprotein(a), this LDL level would benefit from further attention. Recommend a high fiber, low starch, low sugar diet.

Your A1c remains at 5.7%, staying in the prediabetes range, similar to your baseline. While this hasn't progressed to diabetes, it continues to indicate an increased risk that warrants ongoing monitoring.

Please feel free to reach out if you have any questions.

Regards,
Manjula Kamaraju, MD

Manjula Kamaraju, MD Jun 5, 4:06 PM

Hi Srikrishna

Your hepatitis B screening is negative, which is the expected result.

Please feel free to reach out if you have any questions.

Regards,
Manjula Kamaraju, MD

Hi Srikrishna

Your vitamin B12 level has improved to 648 from 332 last year, showing good response to your supplementation. Your vitamin D level is 51, which is in the optimal range after adjusting your dose to 2000 units daily. Your hepatitis B screening is negative. Your A1c remains at 5.7%, consistent with prediabetes and unchanged from previous testing. Your lipid panel shows total cholesterol of 209 with LDL of 140, which remains elevated despite your dietary changes.

Please feel free to reach out if you have any questions.

Regards,
Manjula Kamaraju, MD

Hi Srikrishna

Your labs show generally positive findings. Your vitamin B12 and

Your labs show generally positive findings. Your vitamin B12 and vitamin D levels are now in good ranges, reflecting the improvements from your supplementation. The hepatitis B screening was non-reactive, which is expected. Your testosterone level remains stable and within the normal range.

Your lipid panel shows your total cholesterol and HDL cholesterol have improved, though your LDL cholesterol remains elevated at 140. Your hemoglobin A1c is 5.7%, which remains in the prediabetes range, similar to your previous testing despite your dietary modifications.

Please feel free to reach out if you have any questions.

Regards,
Manjula Kamaraju, MD

Hi Srikrishna

Your latest lab work shows several positive findings. Your vitamin B12 and vitamin D levels are now in the optimal range, which is good progress from your previous deficiencies. Your testosterone level remains within the normal range. Hepatitis B screening was negative.

However, your lipoprotein(a) is at 105, placing it in the moderate cardiovascular risk category. Your LDL cholesterol is elevated at 140, though your HDL has improved to 49. Your hemoglobin A1c remains at 5.7%, consistent with prediabetes. These lipid values indicate there is still room for improvement in your cholesterol management despite your recent dietary changes.

Please feel free to reach out if you have any questions.

Regards,
Manjula Kamaraju, MD

FASTING: YES

FASTING: YES

Hemoglobin A1c

Normal value: <5.7 %

Value

5.7

For someone without known diabetes, a hemoglobin A1c value between 5.7% and 6.4% is consistent with prediabetes and should be confirmed with a follow-up test.

For someone with known diabetes, a value <7% indicates that their diabetes is well controlled. A1c targets should be individualized based on duration of diabetes, age, comorbid conditions, and other considerations.

This assay result is consistent with an increased risk of diabetes.

Currently, no consensus exists regarding use of hemoglobin A1c for diagnosis of diabetes for children.
